1- Project: Document Management System (DMS)

Prepared by: Omar Ayman Shebl Motawea, Gamal Hamed Gamal Aldin, Michael Erian Ayad sadhom

2. Business Need & Context for EDMS

As part of our faculty's administrative modernization, managing paper-based and digital documents across departments currently relies heavily on manual processing, email attachments, and unorganized cloud folders. This manual workflow causes significant approval delays and tracking issues.

3. Implementation Approach

To solve these bottlenecks, the EDMS project follows a structured SDLC process tailored specifically for institutional document control:

- **Planning:** Defined project scope, sponsor alignment, and resource allocation.
- **Analysis:** Interviewed department heads to map multi-level approval routing rules.
- **Design:** Created Entity-Relationship Diagrams (ERD) for document metadata and user permission mapping.
- **Development & Testing:** Built secure upload modules and tested audit trail logging.
- **Implementation:** Deployed the system for administrative staff with dedicated user training sessions.

4. Methodology Selection Conclusion

For this specific document management project, an **Iterative / Agile hybrid methodology** was chosen to allow continuous feedback from administrative personnel during the approval workflow testing phase.
